# Chat server Usage

All the code is in a single file p2pchatserver.cpp
The contacts list ,ie <username> <ipaddr> <portno> is maintained as an unordered_map in the code at starting .
To modify the contacts list , we have to modify the code.
At present we have following users - pcone,pctwo,..pcsix.
Each one has its address as localhost and some random port no .

To build and run the program use the makefile as follows-

```
make clean
make all
make run (prompts for the username)
```

                            OR
```
make brun (prompts for the username)
```

And then open multiple shells and just use `make run` command.
